                                                                                                              Human laminin Bl chain polypeptide fragment, and expression vector: for inhibition of tumour metastasis, wound remedy diagnostic agent etc Claim 1; Fig 1; 20pp; Japanese.

Polypeptide may be produced from a transformed expression system under the control of a tac promoter/operator, an SD sequenc of metapyrocatechase and laq gene.

The gene product has cell binding affinity, and may be used in inhibition of metastasis and infection, wound healing, cell growt as a reagent for laminin assay.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cell strain producing human sperm-immobilising monoclonal antibody has at least V-gene in H chain coding genetic family and V gene in chain of DNA originating from antibody of sterile woman.

Disclosure; ; 14pp; Japanese
A 1.85 kb LVDJ segment is inserted into psV2gpt together with a constant gamma 1 region. A cell strain, pref. a myeloma cell, can produce the Ab with immobilising value (SISO) of at least 5000, sperm agglutination value at least 1:1600 dilution, specifically reacting against human ejaculated sperm. The product can be used

Purified DNA specific for human ryanodine receptor - useful for diagnosis of mailgnant melanoma.

Claim 1; Fig 2; 49pp; English.

The sequence was obtd. from several overlapping clones isolated from a human skeletal muscle cDNA library in lambda gt10. The ge (located on chromosome 19) encodes the human ryanodine receptor

The sustained muscle contraction in malignant hyperthermia (MH) may be caused by the release of calcium into the muscle cell cytoplasm from the SR. This is due to a defect in the gene encoding HRR. Sequences from the gene can be used for diagnosis of MH using FRPL analysis (see tags e-m).
                                                                                        Q11707 standard; DNA; Q11707;
                                                                                                                                                                                                                                                                                                              encoding human 1gX (X = 1gG3, 1gG4, 1gG4, 1gG4, 1gG4, 1gG4). The DNA sequences are obtd. from suitable human celline, e.g. marrow cells, and pref. ARA-10 or Daudi, using a probe for the 1gJH region, and cloned using a vector such as a plasmid (pref.) lambda-phage.

New recombinant DNA molecules - useful in cloning and expressing DNA sequence coding for hepatitis B virus antigenic poly:peptide for use in vaccines

Claim 4; page 37-8; 42pp; English.

The DNA sequence encodes a polypeptide with hepatitis B virus (HBV) antigenicity. The polypeptide is an HBV surface or core antigen. HBV antigens and genes can be obtd. In substantial amts. and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                        N60295 standard; DNA; 549 BP.

DNA encoding hepatitis B virus polypeptide.
DNA encoding hepatitis B virus; ss DNA; vaccine; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis
EP-182442.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant colony stimulating factor-1 protein - is obtd. by recombinant DNA procedures for use in enhancing immune system and for treating monocytes to increase interferon prodn.

Disclosure; Fig 4a-b; 82pp; English.

The CSF-1 protein claimed is esp. human CSF-1, or it may have an equiv. AA sequence, with deletion or conservative substitution of one or more AA, esp. between positions 158 and 224; 51 and 52 and/or 191,192 and193; 15-20 and/or 75-84. The protein is esp. mCSF-1, or 158 deleted CSF-1 or asp (59)-CSF1.

Nucleic acid encoding for P40 T-cell growth factor - for patients with AIDS or compromised immune systems, also allows increased prodn. of other cytokine(s).

Claim 2; Fig 14; 122pp; English.

The sequence was obtd. from a clone, lambda H40.3a1, isolated from a genomic library using a murine P40 cDNA clone as a probe. The sequence, or the cDNA sequence obtd. using the sequence, can be inserted into a vector for expression of P40 in a host organism. The protein is useful for stimulating the proliferation of certain subsets of T helper cells e.g. in AIDS patients or immune
                                                                                                                                                                                                                                                                                                                        compromised patients.

*NOTE: his record contains 192 individual
*sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
*and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
*However, it should not be assumed that this clone
*will be sequenced to completion. In the event that
the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rowen, L., Madan, A., Qin, S., James, R., Loretz, C., Lasky, Shaffer, T. and Hood, L.

On Jun 11, 1999 this sequence version replaced gi:4725958. Order of segments is not known; 800 n's separate segments. IMPORTANY: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector,

IMPORTANT: This sequence is the entire insert of clone GG1. This
clone was sequenced at the Institute of Molecular Medicine. The
true left end of clone GG1 is at 1 in this sequence. The true righ
end of clone GG1 is at 43058.
GG1 is from a 280kb clone contig extending from the telomere of
16p. Higgs D.R., Filnt J. unpublished. MRC Molecular Haematology
Unit, Institute of Molecular Medicine, Oxford.
GG1 came from the Los Alamos, flow sorted human Chromosome 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      alpha and zeta globin genes and 284721

The gene sequence shown below is considered a pseudogene because of the terminating codon at base 429. There are only two additional single-base differences between the coding sequences of the zeta and pseudozeta genes, although there are conspicuous differences in the 5' and 3' flanking regions. Moreover the first intron of this locus demonstrates length variation, apparently stemming from the repeat sequence 'acagigggaggg', which is also found in the zeta gene and, in a similar form, in the 5' flank of the human insulin gene. The repeat sequence 'cgggg' is characteristic of the second introns of the zeta genes [1].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The human alpha globin gene cluster, chromosome 16, spans about 30 kb and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human alpha globin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions.

Cosmid E94 lies between E7 and E126 on the AseI-E genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   codon (atg, gtg, ttg or (att)) which is preceded by an upstream initiation codon. Where possible we choose an initiation ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the instream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each QDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Unpublished
